Introduction

Tumor markers are substances, often proteins, produced by the cancerous tissue itself or sometimes by the body in response to cancer growth that can be detected in body samples such as blood, urine, and tissue. ELISA, IHC, CLIA, and RIA are commonly used immunological methods to detect tumor markers. Tumor markers are of great clinical significance in cancer screening and early detection, diagnostic confirmation, staging, classification, and prognosis of cancers, as well as in the monitoring of therapeutic response and cancer recurrence. They can also assist in the selection of appropriate treatments (e.g., targeted therapy).

Creative Diagnostics offers high-quality humanized antibodies targeting tumor markers with extremely high consistency and excellent specificity, affinity, and sensitivity for tumor marker detection/monitoring and related assay development. Our products cover a wide range of common tumors, including liver, lung, testicles, ovaries, cervix, prostate, breast, skin, gastric, colorectal, and hematological malignancies.
